

Turn-boundary trade-offs in the closed-loop model

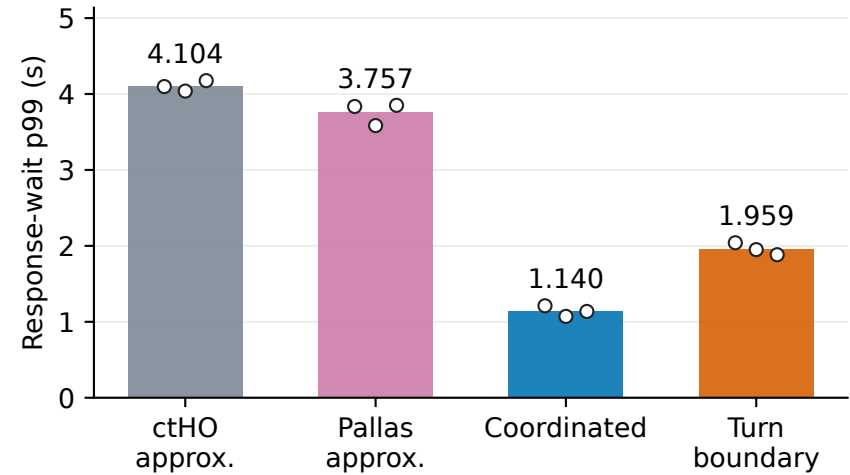

Azure output lengths + synthetic mixed think times

192 mobile users | 600 s | 3 paired seeds

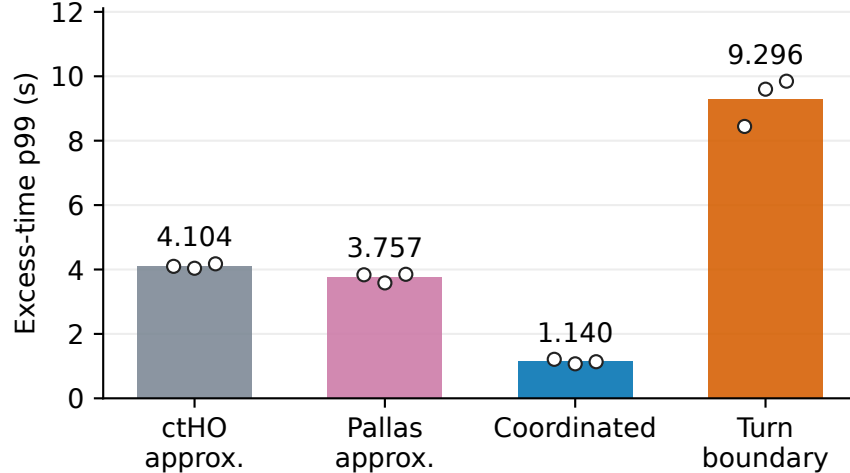

(a) Mean generation wait

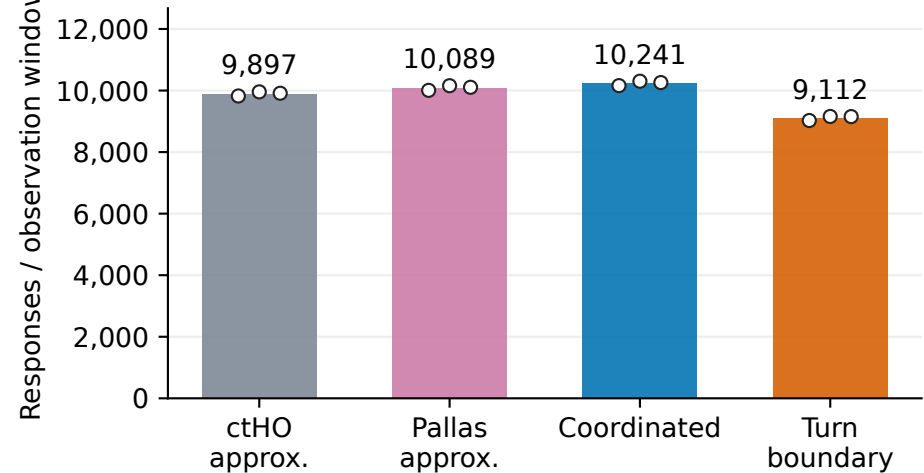

(b) Tail generation wait

(c) Tail excess response time

(d) Completed responses

Bars: seed means; open dots: individual seeds. p99: mean of seed-specific percentiles.

Latency metrics cover fully observed completed responses; completion/censoring differs by policy.

Excess time subtracts output length / base decode rate; it is not first-token latency.
